

CLIMATE-AWARE ANIMAL REVIEW

See animal patterns. Add climate context.

Turn cow and buffalo sensor history into condition scores, alerts and visual trends that support a more informed review.

WORKING SOFTWARE PROTOTYPE • AVAILABLE FOR DEMONSTRATION

One animal. Six screening signals.

Designed for dairy operators, farm managers and animal-health teams.

01

Low oxygen

SpO2 patterns and changes from baseline

02

Fever pattern

Body-temperature trends with sensor context

03

Resting heart rate

Elevated heart rate when movement is low

04

Reduced activity

Movement patterns across sensor windows

05

Heat stress

Temperature, humidity and animal response

06

Cold stress

Cold-weather context and animal response

From uploaded readings to a clearer review

UPLOAD

Sensor CSV with climate data

**SELECT**

Region, species and animal

**SCORE**

Six model scores and threshold alerts

**REVIEW**

Trends, health score and CSV export

A practical starting point for a farm pilot

Bring vital signs and local conditions into one view. Inspect changes over time.
Download prediction histories to support discussion with your animal-health team.

Scores support human review; they do not diagnose illness, prescribe treatment or establish validated early detection.

Start with your animals. Validate in your conditions.

A focused pilot can establish data readiness and practical usefulness before rollout.

Five climate scenarios in the demonstration

Rajasthan Hot and dry	Kerala Hot and humid	Punjab Warm plains	Karnataka Mild plateau	Kashmir Cold winter
---------------------------------	--------------------------------	------------------------------	----------------------------------	-------------------------------

Illustrative seasonal environments, not proof of performance across India's real farms.

30

Livestock

15 cows + 15 buffaloes • 72 hours each • Separate training, validation and test animals

129,600

readings

6

trained classifiers

What you can demonstrate today

- Local browser dashboard and CSV upload
- Animal-specific condition scores and alerts
- Health-score trends and downloadable results
- Separate cow and buffalo features
- Temperature, humidity and wind context
- Review of six distinct condition patterns

Proposed pilot: four clear steps

- 01 Agree the scope** Select farm, animals, priority conditions and review criteria.
- 02 Check the data** Confirm sensors, units, timestamps and one-minute exports.
- 03 Evaluate together** Compare predictions with independently reviewed farm records.
- 04 Plan deployment** Use findings to scope calibration, integrations and rollout.

sensor animal-data export to the system.

Define the scope, data availability and success criteria.

Current delivery is batch CSV analysis. Live-device ingestion, external notifications and production integrations need further work. Clinical accuracy and financial outcomes are undercheck.
